

An iPhone 5 theme

1. Requirements

Must haves (bare minimum):

- Winterboard
Apply the theme with winterboard.
- Lockscreen clockhiding app (example: "Lockscreen Clock Hide")
If you use Lockscreen Clock Hide, the notifications may look odd. They start where you'd expect the clock to start, BUT you still get music controls on double tapping the home button.
Alternatively use Springtomize, Notifications will look better, but you lose the media buttons on double pressing the home button. Experiment for yourselves!
- App to remove the carrier name (example: "No Carrier Name")
You can move the weather icon and the temperature left and right as you please (see the instructions below), but standard I'm assuming you're hiding your carrier name! I use springtomize to set it to nothing, but you can use more apps for this. Again, see the instructions below to move the weather icon and the temperature left or right!

Recommended (Improves the experience):

- ClockFade
Makes the switch to the Springboard statusbar clock nicer. It'll fade in rather than "jump" in.
- iFile
Make modifications without using a computer! NICE! (Please, for initial setup, use a PC... LOADS of settings)
- Lockscreen Dim Delay
Set a longer delay so you can enjoy my theme longer!
- MyLocation
Use the GPS for your weather location rather than setting the weather location.
- Wallpaper JPEGifier
For those of you who like to make new wallpapers on the fly! Check the app's instructions to use properly.

Optional:

- ArrangeStatusBar. Free app to move around statusbar icons ... trick to use though.

2. Shortfalls

I'm not perfect, I'm man enough to admit the shortfalls as well!

- I needed to remove the **statusbar**... Sadly IOS6 forces me to remove it everywhere which makes it look odd in the photo's app. But you get so much more in return!
- I needed to hardcode certain spots in the statusbar which may cause **overlap** in icons and my hardcoded texts/images. Be sure to report these and I'll fix as good as I can. The "Do not disturb" icon has been modified to a spotlight, it jumps funny for a split second when activating, but better than a freakin moon overlapping with your clock!

- As difficult as it may sound, this theme does not include a translation service on the go... I know, really! **Translations** are all hardcoded, meaning if one letter is different, it won't translate! I've tried my best to add as much as I can but I know it won't be enough. See the instructions on adding your translations! I've tried my best to make sure that, in case no translation is found, it defaults back to English.
- When there are **notifications** on the screen, the interactivity won't work. Sadly, no workaround that I know of. I've noticed, using lockscreen clockhide, the interaction DOES still work, but only when pressing where the clock used to be.
- **Loading times** might take a second or 2 (that seem like minutes) when there's a slow internet connection (Edge) or just something wrong with the internet connection. Simply put, the theme is waiting for Yahoo's weather service to answer your update request.

3. Instructions

3.1. Getting started

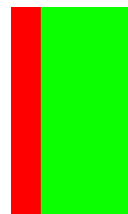

Remove the clock and carrier name, then apply with Winterboard and respring! That's the quick setup ☺! Then follows the fine tuning bit as described in the steps below. I highly recommend changing the initial settings on your computer (if possible) because it'll be faster and easier. To adjust the settings, open the file "Configure me.js" in an editing tool (example on pc: Notepad, on iPhone: iFile). I'll go into detail on every option you got in the next steps. I'll follow the chronological order as in the configure me file.

The screen itself has 3 sections as I call them:

Section one is the general screen, the background and whatnot. Nothing special, just the back end ☺

Section 2 is the red part (left 50 ish pixels of the screen). When you tap this section you'll refresh the page. So you'll refetch weather data, re-random your wallpaper. Handy huh! Just be carefull, it won't refresh apple specific image changes, a golden rule: when in doubt, respring!

Section 3 is the green part. The rest of the screen ☺ Pressing this will call in the forecast screen. Pressing it again will remove the forecast again.

3.2. Set the clocktype to 12h or 24h

Find this line in the configure me file, I won't repeat this in each step, so just imagine they all start with "Find this line":

```
var ClockType = false
```

Change with false/true. For a 12h clock, set to true. For a 24h clock, set to false. The example above is a 24h clock.

3.3. Enable/disable seconds (Warning, battery drainage)

```
var Seconds = false
```

Change with false/true. To enable seconds, set to true, to disable, set to false. In the example above seconds are disabled.

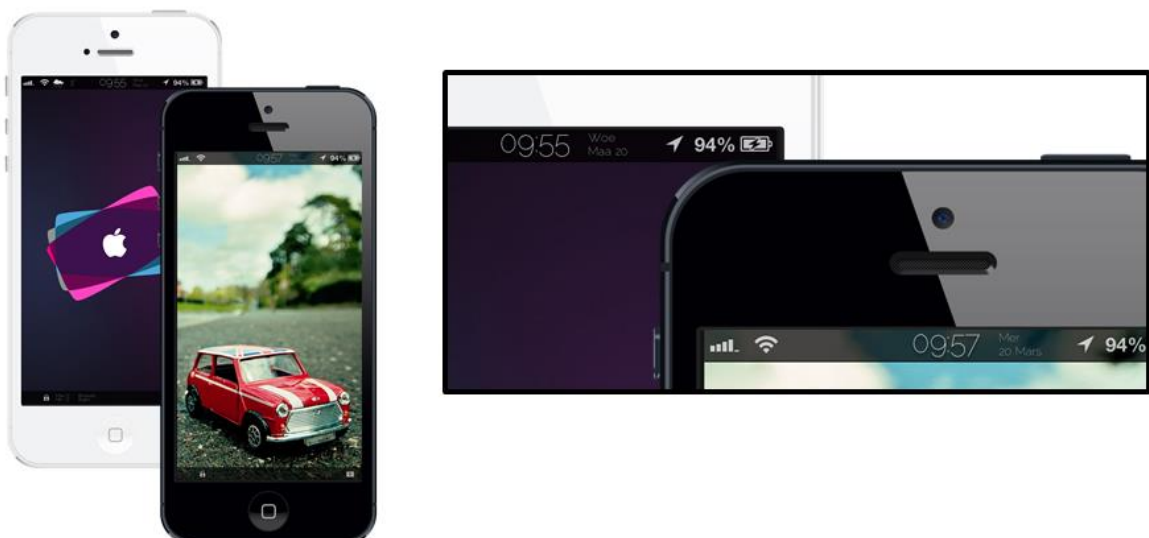

3.4. Change the date format

```
var ReverseDate = false
```

Change with true or false. If this variable is set to false, the date will show as "day" + "month".

Example: 1 Jan. If it's set to true it'll reverse this to "month" + "day", or in my example: Jan 1.

3.5. Remove the statusbar clock

```
var ShowStatusBarClock = true
```

I do believe this is straight forward ☺ true to show, false to hide!

3.6. Remove the statusbar date

```
var ShowStatusBarDate = true
```

Same as the statusbarclock!

3.7. Change the wallpaper settings

```
var WallpaperType = "Random"
```

This variable has 3 options. Make sure they're written between the quotations. These options are case sensitive!

- "Standard": Uses the standard background image "LockBackground.png". Feel free to overwrite this image with yours and using the "Standard" option to display your picture.

- "Jpegifier": This uses the Cydia app "Wallpaper JPEGifier" (free). I suggest you read it's description to see how it works.
- "Random": This is the big dog ☺! I'm going to assume you love my theme and have the full version downloaded including all 6 wallpaper packs. If not, the principle is the same ... but seriously, just download the full version fool! This option has 3 sub-variables. If you're not using random, just skip those 3 variables.

Random will pick a random wallpaper out of a set each time you re-open your lockscreen or refresh the lockscreen. There's always the chance that it'll be the same wallpaper, but it might also not be.... Who knows!

- Changing the wallpaper set

```
var WallpaperSet = "Nature"
```

In here you can modify the pack that'll be displayed. Out of the box the theme (full version) includes 6 packs which can be chose by changing the variable to: "Nature", "City", "Abstract", "Game", "Tv" or "Macro" (case sensitive).

If you like to add your own pack, no problem! In the theme's folder there's a folder named "RandomWall". Open that and you'll see my 6 packs in there. Simply add your own (see details on the next 2 variables tho!). So create a folder, name it (for example) "MyPack" and insert images in there. Images should be named in numbers

starting from 1 to how many pictures are in the pack. See my included packs for an example. Then set this variable to "MyPack". Assuming you modified the next 2 variables correctly as well, the pack will be showed!

- Extensions of your wallpaperpack

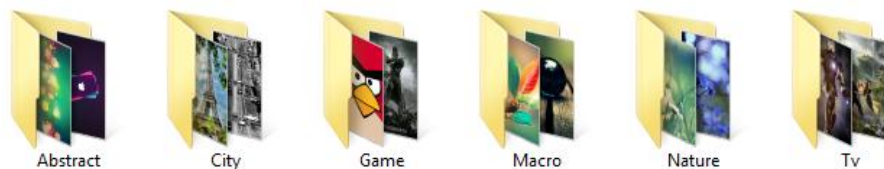

```
var RandExtention = ".jpg"
```

Each image has its extension. My packs use .jpg (mind the dot!). But you can also use other image extensions. If your pack uses different extensions, change this here!

- Set the number of images in your pack

```
var NumberOfImages = 10
```

My packs all have 10 images in them, hence the 10 ☺. If you add for example one superpack with 80 images in it, change this to 80! The script will pick a random number between 1 and your max value, then show the matching image.

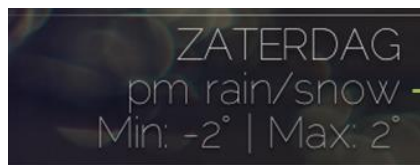

3.8. Language

```
Var Lang = "en"
```

The pack includes a whopping 6 languages! Set "fr" for French, "nl" for Dutch, "de" for German, "es" for Spanish, "it" for Italian or "en" for English. Most translations come from google translate. Should there be any mistakes, find them in the Weather.js file in the scripts folder. The last coded function translates all the weather descriptions. This is likely to miss certain descriptions, or contain a few odd looking translations. To fix wrong translations, just find replace them there! Add more? Sure! Especially in the forecasts Yahoo throws a lot of weird ones at me so I gave up at a point, it'll default to English if it isn't found. To add more, trace down your language in the list (so the block of translations after "if (Lang == "nl") {" for Dutch). Then copy paste one of the lines and replace in lower case the English part with what yahoo threw at you, then replace the translation with your translation. Be careful not to break the code by removing a bracket or something ☺ example:

```
if (ToTranslateTxt=='english lower case') { TranslatedTxt='dutch translation'; }
```

No translation found,
add your own!

3.9. Weather

You have the option to disable weather all together, simply change the following code to false and you won't be bothered with the weather!

```
var EnableWeather = true
```

Using the GPS or your weather code

I'm going to assume you know how the weather widget works. If not, please google it. It's been covered more than hits from the 80s!

Insert your weather code here, or leave at 0 to use the GPS (MyLocation app, free in Cydia!).

```
var locale = "0"
```

Read the app info for its workings! It'll drain your battery slightly more, but that's the price to pay for using the GPS ☺

Clear the slider bar

Not interested in the info noted in the slider bar below? Hide it by changing this like to false!

```
var ShowDetails = true
```

Various other settings regarding weather:

Change between C and F? change to "c" or "f" → `var TempType = "c";`

The self-explanatory update interval is something I won't cover here, and if you're not sure how the change the weather icons I'm skipping that bit as well! ☺ If you want to, you'll google it and figure it out.

There's an option to change to "real feel" temperature. Use with caution since your min/max won't be affected, only the current temperature.

Move the Statusbar weather icons left or right

The final option allows you to move the weathericon and current temperature in the statusbar left or right.

```
var LocationTempStatusbar = 55
```

This is a bit more advanced but I'll explain as simple as I can. Default value is 55, meaning at 55 pixels starting from the left edge, the weather icon and temperature will be placed. With that in mind, modifying this to 0 would place both the icon and temperature smack against the left edge (where your cell reception is ☺). 320 is the right most edge. So if you place it at 320 it'll be knocked off the right edge and invisible. Intermediate numbers place it somewhere along the way! This is handy for those of you who need to move to avoid overlap.

3.10. Credits

Time to give credit where credit is due!

A big thanks to all themers out there. I've learned quite some tricks from you guys.

Thanks to MerlinTheRed for the weathericons:

<http://merlinthered.deviantart.com/art/plain-weather-icons-157162192>

Wallpapers by <http://www.ilikewallpaper.net/>

Font used: Raleway

And a thanks to all whom I forgot to type here. ☺
