

Tutorial for Mibox2 iOS4.0 (formerly iBox Lite Beta)

Step 1: What you need!?

First, you need a jailbroken iPod/iPhone(duh)!!!

Here is the list of the applications you'll need before you install the theme:

1. Cydia and/ou Rock
2. Winterboard (on cydia)
3. Five Column Springboard (on cydia)
4. iBlank (on cydia)
5. Categories (on cydia)
6. MiBox2 Lite or Elite (sur cydia)
7. [iFunBox \(PC/MAC\)](#)

Step 2: Preparing your iPod/iPhone

This step is crucial for the proper functioning of the theme!!!

Create **4 folders** using categories (write exactly as in the field below)

1. Apps
2. Games
3. Social
4. Ebooks and/or News

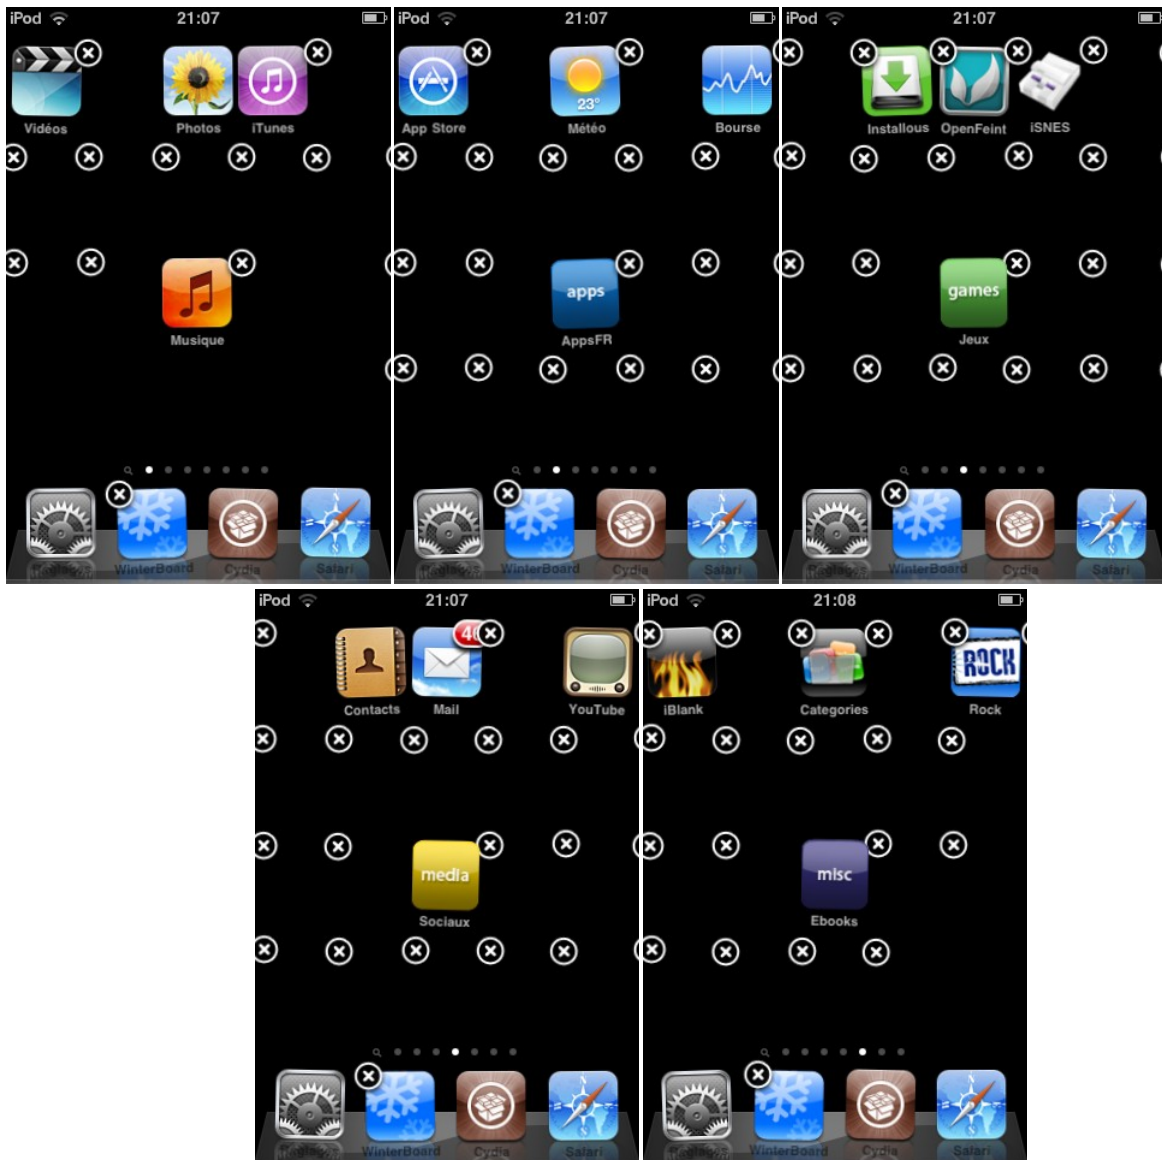

Inside these folders put all of the applications in connection with these folders except for these applications:

1. Videos	9. OpenFeint
2. Photos	10. iSNES
3. iTunes	11. Contacts
4. Music	12. Mail
5. AppStore	13. YouTube
6. Weather	14. iBlank
7. Stock	15. Categories
8. Installous	16. Rock

Step 3: Following preparation

Now that all of your applications are inside your newly created folders, open iBlank and create about 60 blank icons!!!

Once this step is done, move your blank icons and those remaining exactly like shown below:

* Note that to move an icon you have to press 2 or 3 seconds on an icon until it shakes, and then, you have to slide it at the right place! Once complete press the home button. To move several icons at once I suggest you to go to Cydia and download multiiconmover.

Step 4: Apply the theme

Once your icons has been moved exactly like in the images, go to Winterboard, press on SummerBoard mode, then go to Select Themes, select MiBox2 Lite or Elite (What ever is your version) scroll below and also select No-iBlank Shadows Icon. Now go back and press respring or clock the home button. Wait about 10-20 second and there you go MiBox2 is properly installed!!

Step 5: Having the choice

Having a choice is always a good thing, the Elite version offers more than the Lite version (sixty wallpaper, few hundred, twenty lockscreen and a personal Xbox gamer card live) ... and some basic html

* Remember, between each step after editing a html file, do not forget to save and replace file that is already present in the theme. After doing this open Winterboard on iPod / iPhone and press respring to see the changes you've made.

Step 5.1: Changing your wallpaper

To change the wallpaper and select the one you prefer among those in the Wallpaper folder of the theme, just change the name of the wallpaper in the html file. To do this uses any html editor but in this tutorial I'll use Notepad++ available for free here!

First, connect your iPod / iPhone and open **iFunBox**. Once the program recognize your iPod / iPhone go to the following path:

"Raw System-Library-Theme-MiBox2", then copy **Wallpaper.html** and **LockBackground.html** on your computer. Then still in iFunBox, open the folder Wallpaper and remember the name of the wallpaper that you like!

Second, once the files copied to your computer it is time to modify two html files. Start by opening the file **Wallpaper.html**

Identify image as the path for the wallpaper.

Note here that the wallpaper is **Default.png**, you should change it to whatever you want!

For example I will pick one at random.

Then, in your html file, change the **Default.png** chosen wallpaper is here **DS3.png**

Once modified, saved and replace the html file modified by that already present in the theme with iFunBox.

Step 5.2: How to change your Gamerpic

To change the Gamerpic (the little avatar at the right into your screen) you have to do the same thing as for the wallpaper! Find whatever gamerpic you want in the folder **Gamerpic**, edit the file **Wallpaper.html**, spot the path **Gamerpic/Default.png** and change the one chosen by the one you like, example: "**Gamerpic/GOW1.png**". Save the modified file and then replace the file already present in the theme by this one.

Step 5.3: How to change your LockScreen

Step 5.4 How to add your own Live GamerCard and Status bar on your iPod/iPhone
