

Tutorial For

Beta 1.0

Big Thx to SnowLeo, Dark_Ninja & Glasher

The theme I've been tested on these devices:

iPhone 4G-iPhone 3G-iPod 4G-iPod 3G-iPod 2G MC

But for the tutorial I used an iPod 4 generation

MiBox360 is very easy to install if you follow all of the above steps correctly!!! Make sure you have read every steps before asking any question on *How to install MiBox*.

I strongly recommend you not to apply the theme until you finish reading these steps

Step 1: What you need!?

First, you need a jailbroken iPod/iPhone(duh)!!!

Here's the list of the applications you'll need before you install the theme:

1.Cydia

2. Winterboard (on cydia)

3. iBlank(Free) or Gridlock(Paid) (on cydia)

5. Categories(Free) or Categories SB(Paid) (on cydia)

6. MiBox360

7. iFunBox (PC/MAC) or similar program

I strongly recommend you to use **Gridlock instead of **iBlank!!!** It will take less time to configure the theme..**

Step 2: Preparing your iPod/iPhone

This step is crucial for the proper functioning of the theme!!! Create 3 folders using categories (write exactly as in the field below)

1. Apps

2. Games

3. Social

After you've done that, just check out the images below to see where all the applications and folders go.

Note : you can place the big icons in the page you want!!! Music could be your third page but by default I put it in the first page, so as Apps or Games could be your first, second, third page... it doesnt really matter!!! Place the Big Icons regarding to what your needs

Step 3: Following preparation

Before we start moving around icons, remember to create Blank icons if you're using iBlank!!!

So let see what we have here.. In the top we have **Photos-Blank**(for iBlank users)-**Videos and iTune**. After that we have **Mail** then under that we have **Music**!In the dock we have **Calendar,WinterBoard,Cydia** and **Safari**

Second page we have Installous, **Blank**,snes4iphone,iNXES,Game Center and the folder that you've created **Games**

Third page we have **App Store,Blank,VLC,Weather,FaceTime** and your **Apps folder**

In the fourth page we **have Contacts,Blank,Twitter(or Skype),Youtube,Facebook** and your **Social folder**

And for the final page we have **iBlank(or Camera),Clock,Blank,Calculator,Categories** and **Settings**

Step 4: HTML for beginner :P

For the advance user, just find iBox in the html files (LockBackground.html and Widget.html) and replace it by your actual GamerTag on the Xbox Live

Okay now have come the part where most of you will have some difficulties so I'll try my best to explain it!!! **Note that if you don't do that step you will be stick with the default Avatar, GamerPic and GamerCard :S**

First you will need to **edit the html files** you have in the **MiBox360 folder** that you have downloaded!!! You can always use NotePad to do this but I recommend you to use NotePad++. Now, find the **Widget.html** file, right click on it and choose your favourite text editor. Once your html file is open, search inside the html strings for **iBox**... This is what you should see inside the html file...

Widget.html

```
<body>

<div id="Gamerpic">

<SPAN style="position: absolute; top: 50 px; left: 130 px;width:
219px; height: 65px">

    </SPAN>

</a>

</div>

<div id="Avatar">

</div>

</body></html>
```

Now change **iBox** to your actual **GamerTag** you have on the **Xbox Live... example:**

```

<table><td>

<div id="Layer"></div>

<div id="Layer"></div>

<div id="GamerCard"></div>

<div id="Avatar"></div>

<table/><td/>

</body></html>
```

LockBackground.html (After)

```
<body>

<table><td>

<div id="Layer"></div>

<div id="Layer"></div>

<div id="GamerCard"></div>

<div id="Avatar"></div>

<table/><td/>

</body></html>
```

Once you have done these little modifications, you're ready to upload the theme back into your iPod/iPhone!!! **Note to make all the magic work, you will need to put Summerboard on in WinterBoard**

Step 5: Mmmmm more custom sh***
